TEST REPORT

No.: 094172

Investigations with anchoring of roping devices

Customer: Gebr. Schneider Fenster- und Fassadenfabrik
Rechenberger Strasse 7-9
74597 Stimpfach

Basis of testing: Order of 17th of September 2009

Object of testing: Project St. George Wharf: "Eyebolts"

This test report includes 3 pages and 13 annexes.

Date of issue: 9th of October 2009

Annexes 1 to 8: Photos

Annexes 9 to 13: Load-deformation-graphs

1 Preliminary remarks

Tensile tests with the anchoring of roping devices "Eyebolts" were performed by order of the company Gebrüder Schneider Fenster- und Fassadenfabrik GmbH, Stimpfach. The roping devices will be used at the project St. George Wharf. The tests were performed at the Versuchsanstalt für Stahl, Holz und Steine.

2 Object and scope of investigations

The company Gebrüder Schneider GmbH delivered us two test set-ups with each two already mounted roping devices. The set-up consisted of a rectangular hollow section for anchoring the roping device. Two different ways of anchoring were used: Type 1 with a flat steel plate and a washer, type 2 with a washer only. The applications for these different types at the building are shown in Fig. 1 and Fig. 2. The corresponding test set-ups are shown in Fig. 3 and Fig. 4. The tubes 26,9/4,5S235 which can be found in both drawings of the type 2 application in Fig. 2 and the test set-up in Fig. 4 were not included in the delivered set-up.

The roping device itself was labelled "ABS-Lock III, Produktionsjahr 2009, Chargen-Nr. W09004". Two additional roping devices were included to perform additional tests if necessary.

3 Performance and results of tests

Tests were starting with the type 2 application. Failure at the load introduction point at the top of the test set-up occurred in test No. 1, therefore the load introduction point of all the set-ups was strengthened. Then the tests were continued with two tests with the type 2 application and two tests with the type 1 application. Performance of a third test with type 1 (Test No. 6) was not possible due to deformation at the upper flange of the hollow-section. Failure in tests No. 2 to 5 occurred by breaking in the threads of the Eyebolts. Table 1 lists the test results.

Test No.	Type	load-deformation-graph	F _{max}
1	2	Annex 9	113 ¹⁾
2	2	Annex 10	118
3	2	Annex 11	116
4	1	Annex 12	121
5	1	Annex 13	120

¹⁾ Bearing failure at load introduction

Table 1: test results

During the tests deformation of the eye-nut and the upper flange of the hollow section could be observed. The lower flange remained un-deformed.

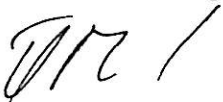

4 Summary

Tensile tests with the anchoring of roping devices "Eyebolts" were performed by order of the company Gebrüder Schneider Fenster- und Fassadenfabrik GmbH, Stimpfach. The results are presented in chapter 3 and shown in the annexes.
